- 3 Recursive neural networks
- 4 Conclusions

Activity 1 due on Sunday

• 5% penalty per day starting next Monday

Siraj is the winner for Activity 1

- Ahmad and Tamer will present today. Please vote accordingly
 - Some hiccups with the voting system last week. Should be fixed now
 - To address Naim's concern, you will now need to input your passcode to vote. You should have received your passcode through email yesterday (from phsamuel2016@gmail.com)
- Thanks to Muhanad, Caffe is up on Schooner
- Maybe quick demo of pbworks during break

- Maybe quick demo of pbworks during break

- Submit your team info, project title, and abstract by the class of the week after spring break (3/23)
 - 5% of the total course
- Group projects are graded the same as single person projects. Given more hands there, a slight penalty is imposed for small group but goes steep as size increases (out of 40)

 # members in group
 2
 3
 4
 5

 Penalty
 -2
 -4
 -8
 -16

 Additional bonus (4% overall) if the projects lead to a submitted publication before course ends

- Next two classes after spring break will be on 3/23 and 3/30 (Thursday for both) and the time will start at 4:30 pm instead of 3:30 pm
- Will send you all another reminder for actual location

- We looked into echo-state networks and also image captioning last time
- More discussion on NLP applications this time

RNN word based language model Tom Mikolov et al. 2010

- We talked about character based language model two classes ago. Let's look into a word based language model today
- Just as the character based model, we can use recurrent unit to memorize the information up to the current word/character
 - However, the word alphabet size can be huge
- This alphabet size problem can be solved using word embedding (word2vec)
 - For any word, first code the word using one-hot encoding
 - That is, a "delta" vector with length of the total number of words. And every component is zero except the location corresponding to the input word
 - Multiply the one-hot vector by an embedding matrix *L*. The embedding matrix shrink the dim of the one-hot vector

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

RNN word based language model Tom Mikolov et al. 2010

- We talked about character based language model two classes ago. Let's look into a word based language model today
- Just as the character based model, we can use recurrent unit to memorize the information up to the current word/character
 - However, the word alphabet size can be huge
- This alphabet size problem can be solved using word embedding (word2vec)
 - For any word, first code the word using one-hot encoding
 - That is, a "delta" vector with length of the total number of words. And every component is zero except the location corresponding to the input word
 - Multiply the one-hot vector by an embedding matrix *L*. The embedding matrix shrink the dim of the one-hot vector

- *x_t* is word at *t* position and **x**^(*t*) is its one-hot **row**-vector representation
- Vocab size: |V|; Embedding dim: d; Hidden Layer dim: D_h

$$\mathbf{e}^{(t)} = \mathbf{x}^{(t)}L$$
$$\mathbf{h}^{(t)} = sigmoid(\mathbf{h}^{(t-1)}H + \mathbf{e}^{(t)}I + \mathbf{b}_1)$$
$$\hat{\mathbf{y}}^{(t)} = softmax(\mathbf{h}^{(t)}U + \mathbf{b}_2)$$
$$p(x_{t+1} = v_j | x_t, \cdots, x_1) = \hat{y}_j^{(t)}$$

Note that $L \in \mathbb{R}^{|V| \times d}$, $H \in \mathbb{R}^{D_h \times D_h}$, $I \in \mathbb{R}^{d \times D_h}$, $U \in \mathbb{R}^{D_h \times |V|}$, $\mathbf{b}_1 \in \mathbb{R}^{D_h}$, $\mathbf{b}_2 \in \mathbb{R}^{|V|}$, where $d \ll |V|$

- *x_t* is word at *t* position and **x**^(*t*) is its one-hot **row**-vector representation
- Vocab size: |V|; Embedding dim: d; Hidden Layer dim: D_h

$$\begin{aligned} \mathbf{e}^{(t)} &= \mathbf{x}^{(t)} L\\ \mathbf{h}^{(t)} &= sigmoid(\mathbf{h}^{(t-1)}H + \mathbf{e}^{(t)}I + \mathbf{b}_1)\\ \hat{\mathbf{y}}^{(t)} &= softmax(\mathbf{h}^{(t)}U + \mathbf{b}_2)\\ p(x_{t+1} &= v_j | x_t, \cdots, x_1) &= \hat{y}_j^{(t)} \end{aligned}$$

Note that $L \in \mathbb{R}^{|V| \times d}$, $H \in \mathbb{R}^{D_h \times D_h}$, $I \in \mathbb{R}^{d \times D_h}$, $U \in \mathbb{R}^{D_h \times |V|}$, $\mathbf{b}_1 \in \mathbb{R}^{D_h}$, $\mathbf{b}_2 \in \mathbb{R}^{|V|}$, where $d \ll |V|$

- *x_t* is word at *t* position and **x**^(*t*) is its one-hot **row**-vector representation
- Vocab size: |V|; Embedding dim: d; Hidden Layer dim: D_h

$$\begin{aligned} \mathbf{e}^{(t)} &= \mathbf{x}^{(t)} L\\ \mathbf{h}^{(t)} &= sigmoid(\mathbf{h}^{(t-1)}H + \mathbf{e}^{(t)}I + \mathbf{b}_1)\\ \mathbf{\hat{y}}^{(t)} &= softmax(\mathbf{h}^{(t)}U + \mathbf{b}_2)\\ p(x_{t+1} &= v_j | x_t, \cdots, x_1) &= \mathbf{\hat{y}}_j^{(t)} \end{aligned}$$

Note that $L \in \mathbb{R}^{|V| \times d}$, $H \in \mathbb{R}^{D_h \times D_h}$, $I \in \mathbb{R}^{d \times D_h}$, $U \in \mathbb{R}^{D_h \times |V|}$, $\mathbf{b}_1 \in \mathbb{R}^{D_h}$, $\mathbf{b}_2 \in \mathbb{R}^{|V|}$, where $d \ll |V|$

- *x_t* is word at *t* position and **x**^(*t*) is its one-hot **row**-vector representation
- Vocab size: |V|; Embedding dim: d; Hidden Layer dim: D_h

$$\begin{aligned} \mathbf{e}^{(t)} &= \mathbf{x}^{(t)} L\\ \mathbf{h}^{(t)} &= sigmoid(\mathbf{h}^{(t-1)}H + \mathbf{e}^{(t)}I + \mathbf{b}_1)\\ \mathbf{\hat{y}}^{(t)} &= softmax(\mathbf{h}^{(t)}U + \mathbf{b}_2)\\ p(x_{t+1} &= v_j | x_t, \cdots, x_1) = \mathbf{\hat{y}}_j^{(t)} \end{aligned}$$
Note that $L \in \mathbb{R}^{|V| \times d}, H \in \mathbb{R}^{D_h \times D_h}, I \in \mathbb{R}^{d \times D_h}, U \in \mathbb{R}^{D_h \times |V|}, \mathbf{b}_1 \in \mathbb{R}^{D_h}, \mathbf{b}_2 \in \mathbb{R}^{|V|}, \text{ where } d \ll |V| \end{aligned}$

• We will try to minimize cost entropy as usual. Namely,

$$CE(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)}) = -\sum_{i=1}^{|V|} y_i^{(t)} \log \hat{y}_i^{(t)}$$

• Conventionally, linguists use perplexity to measure the performance of their model, which is just the inverse of the predicted probability of the actual word. That is,

$$PP^{(t)}(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)}) = \frac{1}{\hat{p}(x_{t+1}^{pred} = x_{t+1} | x_t, \cdots, x_1)} = \frac{1}{\sum_{j=1}^{|V|} y_j^{(t)} \cdot \hat{y}_j^{(t)}}$$

And since $\mathbf{y}^{(t)}$ is one-hot,

$$PP^{(t)}(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)}) = \frac{1}{e^{-CE(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)})}} = e^{CE(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)})}$$

Therefore, minimizing CE = minimizing perplexity

We will try to minimize cost entropy as usual. Namely,

$$CE(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)}) = -\sum_{i=1}^{|V|} y_i^{(t)} \log \hat{y}_i^{(t)}$$

• Conventionally, linguists use perplexity to measure the performance of their model, which is just the inverse of the predicted probability of the actual word. That is,

$$PP^{(t)}(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)}) = \frac{1}{\hat{p}(x_{t+1}^{pred} = x_{t+1} | x_t, \cdots, x_1)} = \frac{1}{\sum_{j=1}^{|V|} y_j^{(t)} \cdot \hat{y}_j^{(t)}}$$

And since $\mathbf{y}^{(t)}$ is one-hot,

$$PP^{(t)}(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)}) = \frac{1}{e^{-CE(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)})}} = e^{CE(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)})}$$

Therefore, minimizing CE = minimizing perplexity

We will try to minimize cost entropy as usual. Namely,

$$CE(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)}) = -\sum_{i=1}^{|V|} y_i^{(t)} \log \hat{y}_i^{(t)}$$

• Conventionally, linguists use perplexity to measure the performance of their model, which is just the inverse of the predicted probability of the actual word. That is,

$$PP^{(t)}(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)}) = \frac{1}{\hat{p}(x_{t+1}^{pred} = x_{t+1} | x_t, \cdots, x_1)} = \frac{1}{\sum_{j=1}^{|V|} y_j^{(t)} \cdot \hat{y}_j^{(t)}}$$

And since $\mathbf{y}^{(t)}$ is one-hot,

$$PP^{(t)}(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)}) = \frac{1}{e^{-CE(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)})}} = e^{CE(\mathbf{y}^{(t)}, \hat{\mathbf{y}}^{(t)})}$$

Therefore, minimizing CE = minimizing perplexity

Embedding dim: d = 50; Hidden Layer dim: $D_h = 100$

- The meaning of life is now.
- The meaning of life is myself, that I was going in wos looking and Norman Lollards
- The meaning of life is just an demons it is, it directed their invisible Joan, at the public-house.
- The meaning of life is King Ada to it, something duty out Mr. Dick, who Richard only back for your her dress; Oliver is give by subdued at the old in deplorably meditative under the window, was the concessions

Demo

Name Entity Recognition (NER)

- Goal: try to predict whether a given word in a sentence is a name and its category
 - Person (PER)
 - Organization (ORG)
 - Location (LOC)
 - Miscellaneous (MISC)
- For example,
 - John lives in Oklahoma and studies at the University of Oklahoma
 - The Republicans will repeal the Affordable Care Act

Name Entity Recognition (NER) See also http://nlp.stanford.edu/software/CRF-NER.html#Models

 To get the context of the input word, we may include its neighbors as input

$$\widetilde{\mathbf{x}}^{(t)} = [\mathbf{x}^{(t-k)}, \cdots, \mathbf{x}^{(t)}, \cdots, \mathbf{x}^{(t+k)}] L \in \mathbb{R}^{3d}$$

• For a simplest model,

$$\mathbf{h} = tanh(\tilde{\mathbf{x}}^{(t)}W + \mathbf{b}_1)$$
$$\hat{\mathbf{y}} = softmax(\mathbf{h}U + \mathbf{b}_2)$$

• Let k = 1, d = 50, $D_h = 100$

Name Entity Recognition (NER) See also http://nlp.stanford.edu/software/CRF-NER.html#Models

 To get the context of the input word, we may include its neighbors as input

$$\widetilde{\mathbf{x}}^{(t)} = [\mathbf{x}^{(t-k)}, \cdots, \mathbf{x}^{(t)}, \cdots, \mathbf{x}^{(t+k)}] L \in \mathbb{R}^{3d}$$

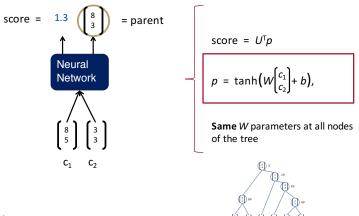

• For a simplest model,

$$\mathbf{h} = tanh(\tilde{\mathbf{x}}^{(t)}W + \mathbf{b}_1)$$
$$\hat{\mathbf{y}} = softmax(\mathbf{h}U + \mathbf{b}_2)$$

Parsing a sentence

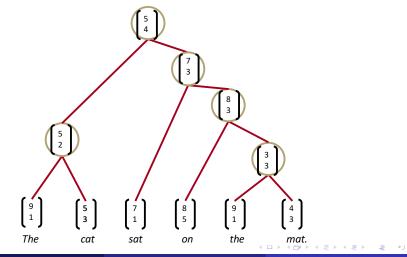

Parsing a sentence

S. Cheng (OU-Tulsa)

Parsing a sentence

S. Cheng (OU-Tulsa)

Parsing sentence optimizing overall score

Max-Margin Framework - Details

 The score of a tree is computed by the sum of the parsing decision scores at each node:

$$s(x,y) = \sum_{n \in nodes(y)} s_n$$

. C

Paraphrase Detection

Pollack said the plaintiffs failed to show that Merrill and Blodget directly caused their losses

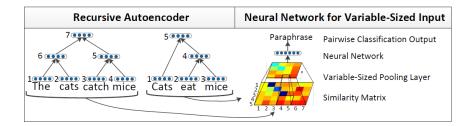

Basically , the plaintiffs did not show that omissions in Merrill's research caused the claimed losses

The initial report was made to Modesto Police December 28

It stems from a Modesto police report

RNNs for Paraphrase Detection

Unsupervised RNNs and a pair-wise sentence comparison of nodes in parsed trees (Socher et al., NIPS 2011)

RNNs for Paraphrase Detection

Experiments on Microsoft Research Paraphrase Corpus (Dolan et al. 2004)

Conclusions

Briefly introduced NLP problems

- Language generative model
- Name entity recognition
- Paraphrase detection (and parsing)
- Looked into another type of RNNs (recursive neural networks). Not to be confused with recurrent neural networks

Conclusions
